## November 2005

Published\_Applications Nucleic Acid and Published\_Applications Amino Acid database searches now generate two sets of results each. The Published\_Applications databases have been split into two parts to reduce the amount of time required for their daily updates. This results in more machine time being available for processing searches.

Newly published applications will appear in the Published\_Applications\_New databases; older published applications make up the Published\_Applications\_Main databases.

Searches run against Nucleic Acid Published\_Applications produce two sets of results, with the extensions .rnpbm (Published\_Applications\_NA\_Main) and .rnpbm (Published\_Applications\_NA\_New).

Searches run against Amino Acid Published\_Applications produce two sets of results, with the extensions .rapbm (Published\_Applications\_AA\_New).

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Description

N-terminal peptide, SEQ ID NO: 11. tioxidant, transgenic plant; ESULT 1 EB16913

New expression vector comprising a nucleic acid sequence encoding a polypeptide having monooxygenase P450 activity, useful in altering the carotenoid production in a plant for enhancing production of specific carotenoid compounds.

Claim 8; SEQ ID NO 11; 135pp; English.

The present invention relates to genes, proteins and methods comprising carotenoid monooxygenases in the cytochrome P450 family. The invention also relates to altering carotenoid ratios in plants and microoxganisms using LUT1 epsilon-hydroxylases and/or CYP97A beta-hydroxylases. The invention is useful in altering the carotenoid production in a plant for enhancing production of specific carotenoid compounds that are potent antioxidants. The present sequence is thale cress chlorophyll-targeting N-terminal transit peptide.

Claim 9; SEQ ID NO 4; 135pp; English.

```
The invention relates a recombinant DNA construct comprising a polymucleotide having any of 5544 nucleotide sequences (CDNAs SEQ ID NO: 15544) and encoding a polypeptide with any of 5544 amino acid sequences (SED ID NO: 5545-11088). The CDNAs and proteins are from corn, soybean, Arabidopsis, wheat and rape but the specification does not indicate which sequences is derived from which organism. Also included is a method of producing a plant having an improved property, comprising transforming a plant with a recombinant DNA construct comprising a promoter region functional in a plant cell operably joined to a polynucleotide encoding a polypeptide associated with the property, and growing the transformed plant. The property is selected from improving plant cold tolerance, for manipulating growth rate in plant cells by modification of the cell cycle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New recombinant DNA constructs useful in the field of biochemistry and genetics, and in particular for producing transgenic plants with improved
The present invention relates to genes, proteins and methods comprising carotenoid monooxygenases in the cytochrome P450 family. The invention also relates to altering carotenoid ratios in plants and microorganisms using LUT1 epsilon-hydroxylases and/or CYP97A beta-hydroxylases. The invention is useful in altering the carotenoid production in a plant for enhancing production of specific carotenoid compounds that are potent antioxidants. The present sequence is thale cress LUT1 [cytochrome P450 monooxygenase (CYP97C1); AL5951310 genel protein. Note: The current sequence is that of thale cress LUT1 protein that is encoded by cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    plant; transgenic; cold tolerance; growth rate; drought tolerance; disease resistance; galactomannan production; plant growth regulator; heat tolerance; herbicide tolerance; lignin production; extreme osmotic condition tolerance; pathogens resistance; pest resistance; yield improvement; seed oil yield; seed protein yield.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

co pathway, for improving plant drought tolerance, for providing increased resistance to plant disease, for galactomannan production, for production of plant growth regulators, for improving plant heat tolerance. for improving plant tolerance to herbicides, for increasing the rate of homologous recombination in plants, for lignin production, for improving plant tolerance to extreme osmotic conditions, for improving plant tolerance to pathogens or peets, for yield improvement by modification of photosynthesis, for modifying seed oil yield and/or content, for modification of carbohydrate, nitrogen or phosphorus use and/or uptake and for yield improvement by providing improved plant growth and modification of carbohydrate, nitrogen or phosphorus use and/or uptake and for yield improvement by providing improved plant growth and evelopment under at least one stress condition. The polymiclectide may also encode a plant transcription factor. The methods and compositions of the present invention are useful in the field of biochemistry and compositions also encode a plant transcription factor. The methods and compositions of the present invention are useful in the field of biochemistry and biological characteristics such as increased yield, improved nitrogen biological characteristics such as increased plants with improved biological characteristics such as increased storing plant tolerance to cold or heat, improving plant tolerance to extreme osmotic and drought conditions, and improving plant colerance to plant psets or pathogens. They can also be used in physical arrays of molecules, plant breeding markers, computer-based storage and analysis systems. The present sequence is one of the 5544 plant protein cold cord cord or cord or conditions of the invention. Note: The sequence data for this patent did electronic format directly from USPND at sequence of the printed specification, but was obtained in electronic format directly from USPND at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel isolated nucleic acid encoding a S'-phosphoribosyl-5-aminoimidazole synthase, used to transform plant cells, for use in screening for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              synthetase from Arabidopsis. The AIR synthetase protein can be expressed by standard recombinant methodology. Nucleic acids encoding the AIR synthetase are used for producing transgenic plants and plant cells, for screening herbicidal compounds which inhibit the enzymatic activity of AIR synthetase. The present sequence represents an Arabidopsis AIR synthetase sequence
          The present sequence is A. thaliana AIR (5'-phosphoribosyl-5--
aminoindazole) synthetese pre-protein, an enzyme involved in de novo
purine biosynthesis. The cDNA is deposited in E. coli strain DifsapASM
designated as NRRL accession number B-21976. Recombinantly produced AIR
synthetese enzyme can be used in screening chemicals for herbicidal
activity. Plants having modified enzyme activity are tolerant to
inhibition by herbicides. Herbicide-tolerant AIR synthetase is also
                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The present invention relates to polymucleotide sequences, and the proteins they encode. The sequences are isolated from a variety of organizams unto as plants (e.g. maize, rice, sorghum, thale cress, corgonal and wheat), cyanobacteria, bacteria, yeast and other fungi. The polymucleotide and polypeptide sequences of the invention are useful in the production of transgenic plants that have improved properties. Also disclosed are methods of producing fertile transgenic plants, preferably maize, with desired phenotypes. The polymucleotide and polypeptide sequences are useful for improving plants by providing protection against sequences are useful for improving plants by providing protection against modifying the cell cycle pathway, reducing plant height, modifying carbohydrate transport, improving crop productivity, improving plant growth and stress resistance, improving disease resistance, improving plant assimilation, improving stalk strength, improving native and ablotic and absorbed in the control of improving plant assimilation, improving stalk strength, improving and absorbed in a subject of improving plants of improving pla
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            stress resistance, improving resistance to oxidative stress, providing increased vigour, reducing senescence, and conferring virus resistance. The present sequence represents a polypeptide sequence of the invention. Note: The sequence data for this patent is not provided in the printed specification but is obtained in electronic format from the USPTO website

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
                                                                                                                                                                                                                                               The invention relates to identifying target proteins (ABB90790-ABB94016) for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms using suttable search parameters, where plant sequences having an E-value greater by a factor of 3 than the E-value of most similar non-plant sequences are selected. The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are useful as
                                                                                                                                                                           sednences

Sequence 69, Application US/08977221
Patent No. 6084069
GENERAL INFORMATION:
APPLICANT: UNITED STATES OF AMERICA, DEPT.
APPLICANT: OF HEALTH AND HUMAN SERVICES
TITLE OF INVENTION: MOTILITY STIMULATING
TITLE OF INVENTION: PROTEIN USEFUL IN CANCER DIAGNOSIS AND
TITLE OF INVENTION: THERAPY
NUMBER OF SEQUENCES: 69
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DB 2; Length 915;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CLASSIFICATION:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Dyesthoribosylformylglycinamidine cyclo-ligase (EC 6.3.3.1) precursor - Arabidopsis thal

NyAlternate names: 5'-phosphoribosyl-5-aminoimidazole synthetase; protein F28P10.10

C;Species: Arabidopsis thaliana (mouse-ear cress)

C;Date: 30-Sep-1993 #sequence_revision 28-Oct-1994 #text_change 15-Oct-1999

C;Accession: J02256; T06719

Plant Physiol. 102, 387-399, 1993

A;Fitle: Isolating the Arabidopsis thaliana genes for de novo purine synthesis by suppre

SUBCELLUIAR LOCATION: Chloroplast.
SIMILARITY: Belongs to the AIR synthase family.
CAUTION: Ref. is sequence differs from that shown due to a frameshift in position 344.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CATALYTIC ACTIVITY: ATP + 2-(formamido)-N(1)-(5-phospho-D-ribosyl)acetamidine = ADP + phosphate + 5-amino-1-(5-phospho-D-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Full-length CDNA from Arabidopsis thaliana.";
Submitted (MAR-2002) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Catalyzes the key reaction of chlorophyll catabolism,
porphyrin macrocycle cleavage of pheophorbide a (pheide a) to a primary fluorescent catabolite (pFCC). Works in a two-step reaction with pheophorbide a oxygenase (PaO) by reducing the C20/CI double bond of the intermediate, RCC.
-!- COFACTOR: Reduced ferredoxin.
-!- COFACTOR: Reduced ferredoxin.
-!- PATHWAY: Chlorophyll degradation, fourth step.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          mitochondria of 7-day-old seedlings.
TISSUE SPECIFICITY: Expressed in all tissues tested, including
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    change of levels during senescence or pathogen attack. MISCELLANEOUS: The absence of light completely suppresses cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Chloroplast (Potential).
Red chlorophyll catabolite reductase.
Potential.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       EMBL; AY093785; AAM10401.1; -; mRNA.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

US-10-51-235-14

Sequence 14, Application US/10751235

Sequence 14, Application No. US20050150002A1

GENERAL INFORMATION:
APPLICANT: DellaPenna, Dean
APPLICANT: Tian, Li
APPLICANT: Kim, Joonyul
TITLE OF INVENTION: Novel Carotenoid Hydroxylases for Use in Engineering Carotenoid
TITLE OF INVENTION: Metabolism in Plants
FILE REFERENCE: MSU-08604

CURRENT APPLICATION NUMBER: US/10/751,235

CURRENT PILING DATE: 2004-01-02

NUMBER OF SEQ ID NOS: 74

SOUTWARE: PatentIn version 3.2
